---

You are a cinematic drone and automotive videographer producing a hyperrealistic travel film. Generate a scenic drive sequence through the Amalfi Coast, Italy, built as 4 distinct 4-second shots (16 seconds total).

WORLD FIRST: golden-hour Mediterranean light, steep terraced cliffs dropping into turquoise sea, narrow switchback coastal road (SS163), pastel-colored villages clinging to the hillside, scattered lemon groves, soft haze over the water.

SHOT 1 (0-4s), Establishing Aerial. Wide view of the Amalfi coastline at golden hour, cliffs and colorful villages visible below. No action, static establishing view. Slow drone push-in, high altitude, descending gently toward the coastline. Photorealistic, natural sunlight, slight lens haze, true-to-life color grading. Awe-inspiring, cinematic travel documentary.

SHOT 2 (4-8s), Aerial Tracking the Road. The winding coastal road hugging the cliffside, sea on one side, rock face on the other. A single vintage convertible driving along the road at

moderate speed. Drone chase shot tracking parallel to the car from a 45-degree elevated angle, smooth and steady. Photorealistic, realistic motion blur on wheels, authentic road reflections. Freedom, adventure.

SHOT 3 (8-12s), Driver POV / Low Angle. Close to road level, cliffside guardrail and sea visible in peripheral frame. The car rounds a curve, wind visibly moving the driver's hair and a loose scarf. Low-angle tracking shot from just behind and beside the car, locked focus on the vehicle, slight handheld micro-shake for realism. Photorealistic, shallow depth of field, natural lens flare from low sun. Intimate, immersive.

SHOT 4 (12-16s), Final Aerial Pull-Back. The village of Positano in the distance, sea sparkling under late afternoon light. The car disappears around a bend toward the village. Drone pulls back and rises, revealing the full coastline and village skyline. Photorealistic, warm color grade, filmic contrast, no stylization or CGI look. Cinematic, triumphant conclusion.

Maintain consistent lighting direction, the same vintage convertible, and the same color grade across all shots. Natural physics for car suspension, tire contact, and wind interaction. Avoid: cartoonish rendering, unrealistic drone instability, warped geometry, text artifacts, oversaturated colors, inconsistent time-of-day lighting between shots.
